

End-to-end pipeline

`run_mvp()` orchestrates all objectives. The notebook then filters and presents Awareness results.

Awareness: scores, actions and budgets

Three distinct outputs: performance estimates, action labels, and budget allocations.

Reading the architecture

Execution details, policy boundaries and the objects returned to the notebook.

SCORING RULES

Primary benchmark

Use at least two valid same-objective peers. Awareness may fall back to compatible Awareness + Engagement Link CTR peers. That fallback is provisional and caps assessable actions at KEEP_AS_TEST.

Conversation quality

Select the earliest mature conversation per customer within each entity before checking labels. Awareness success means ad alignment supported by message evidence. Unknown and missing labels are excluded from assessable trials.

Semantic benchmark

Use same-objective peers only. If peers are insufficient, use Beta(0.5, 0.5) smoothing and show a range without a peer-comparison claim.

Budget policy

Total configured budget: 100 units. Preserve each objective's previous spend share, then allocate its envelope using normalized priority products. The product is a policy index, not a joint probability or an optimal return estimate.

Scope: completed-cycle analysis. CTR is a response proxy, not proof of brand-awareness lift. This guide describes the reviewed code; it does not execute campaigns or validate extracted labels.

NOTEBOOK INTERFACE

run_mvp() returns MVPResult

data: normalized source data

scorecards: campaign, adset, ad, creative, audience

semantic_evidence: conversation selection audit

Decision and recommendation objects

allocations: campaign budget records

exploration_tests: proposed next-cycle tests

recommendation_input / optional recommendation_output

Notebook behavior: the first code cell runs the complete pipeline and writes outputs. Later cells primarily display results for OUTCOME_AWARENESS; some reconstruct calculations for explanation.
